Report No. 10-12L, supported by the U.S. Air Force Medical Logistics Agency, under Work Unit No. 60334. The views expressed in this article are those of the authors and do not reflect the official policy or position of the Navy, Department of Defense, or the U.S. Government. Approved for public release; distribution is unlimited. This research has been conducted in compliance with all applicable federal regulations governing the protection of human subjects. No human subjects were directly involved in this research.

Executive Summary

The Naval Health Research Center (NHRC) has used its modeling and simulation expertise to develop and update conventional U.S. Air Force medical assets since 2004. NHRC medical modeling capabilities currently capture the care and treatment of the sick and injured from the first responder through theater hospitalization.

The objective of this study was to leverage NHRC's unique medical modeling and simulation to provide recommendations for allowance standard (AS) configurations based on Air Force Oral Surgery Team (FFMAX) operational and clinical requirements. NHRC analysts reviewed the FFMAX, analyzed clinical requirements with subject matter experts, and used modeling and simulation tools to develop the operationally-based and patient-driven recommended 917P line list.

The Unit Type Code (UTC) capabilities, operational requirements, and materiel solutions were identified, addressing issues of modernization, clinical requirement, standardization, and redundancy. Total recommended changes to the FFMAX would result in a 34.5% weight reduction, a 31% cube reduction, and a 6.8% cost reduction, or \$43,899.08.

Modeling a medical system like the FFMAX, with a range of capabilities and functional areas, validates the materiel solutions for each UTC. It is effective in facilitating AS reviews that focus on advancing the mission, operational requirements, and capabilities of these agile, deployable medical resources.

Introduction

The Naval Health Research Center (NHRC) has used its modeling and simulation expertise to develop and update U.S. Air Force medical capabilities, allowance standards (ASs), and surgical subspecialty Unit Type Codes (UTCs) since 2004. Air Force medical units must remain small, light, and flexible. Based on the success of previous work, the Air Force asked NHRC to conduct a review of the Air Force Oral Surgery Team (FFMAX) (Konoske, 2009).

The U.S. Air Force Medical Services are faced with a wide range of potential scenarios, from providing warfighters forward resuscitative care to assisting civilian populations during humanitarian relief operations. Air Force planners and UTC developers have closely followed the *Joint Vision 2010* concept of providing highly mobile medical resources with a minimal logistic footprint, without compromising capability (Office of the Joint Chiefs of Staff, 1998). Additionally, guidance provided by the *Joint Vision 2020* calls for a more scientific approach that leverages and enhances existing information technologies to support modern operational capabilities (Office of the Joint Chiefs of Staff, 2000). Emphasis on mobility and capability resulted in a modular approach to prepare, plan, and deploy the FFMAX expeditionary medical platform.

Method

The NHRC method of modeling medical supply requirements was developed to establish and/or review medical inventories for various levels of care. The aim is to give clinicians in the field the needed materiel to provide the best care possible, while still maintaining as small a logistical footprint as possible. This is accomplished through a process that begins with the identification of likely patient types to be encountered by a particular type of medical treatment asset, including combat wounds, non-battle injuries, and illnesses. *International Classification of Diseases*, Ninth Revision (ICD-9) coded patient conditions that have been selected by the Defense Medical Materiel Program Office are used for this purpose. The types of ICD-9 patient codes are provided in Appendix A. Figure 1 illustrates the NHRC processes used when developing a modeling and simulation package.

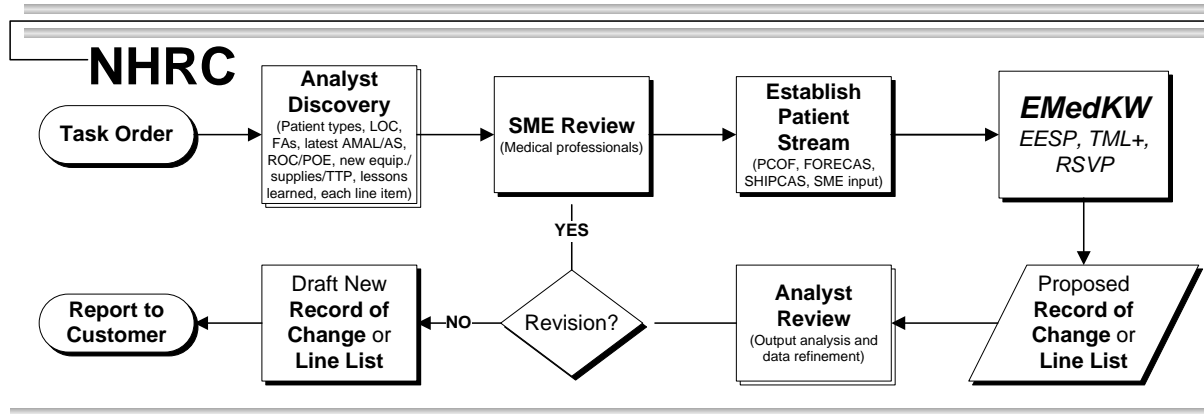

Figure 1. An example of the NHRC AS review process.

Subject Matter Expert Guidance

A subject matter expert (SME) AS review was performed on January 23, 2010. At this meeting, SMEs and NHRC analysts refined and validated assumptions regarding equipment and supply associations, and the range and scope of patient types.

Patient Stream

To determine the initial supply and equipment requirements, NHRC analysts generated an FFMAX scenario. The patient stream was developed from 78 patients, which were documented in a surgical log by an oral surgeon during Operation Iraqi Freedom between October and December 2007. The patient stream was used to simulate the equipment and supply requirements for the range of surgical cases and non-surgical injuries and illnesses that would typically be seen and treated over a 30-day period. Table 1 displays the patient stream.

Expeditionary Medical Knowledge Warehouse

The patient stream is input to the Expeditionary Medical Knowledge Warehouse (EMedKW) program to perform modeling and simulation. EMedKW is comprised of the (EESP), the Tactical Medical Logistics (TML+) planning tool, and the ReSupply Validation Program (RSVP). EMedKW is a service-oriented architecture system designed to protect and organize medical data. EMedKW provides the ability to estimate the equipment and consumable items needed to treat a particular patient distribution, while also tracking inventory to monitor mission readiness. Within EMedKW, the tasks required to treat each PC code are identified and matched with the required equipment and consumable items. Review of the output informs the appropriate modifications to the 917P line list for the Air Combat Command Manpower and Equipment Force Packaging System review.

The following example describes the EMedKW data structure (see Figure 2). The task profile shows the likely clinical tasks to be performed on this type of patient in that functional area, and the percentage of those patients expected to receive them. The “Equipment/supplies” column identifies the items needed to complete the “Insert endo-trach tube” task at that level of capability. Not shown in this figure are additional data fields used to calculate supply quantities, including the amount of each supply needed to complete the task, how often the task will be repeated in the first 24 hours of treatment,

how often the task will be repeated in each subsequent 24-hour period, and the average length of stay at that facility.

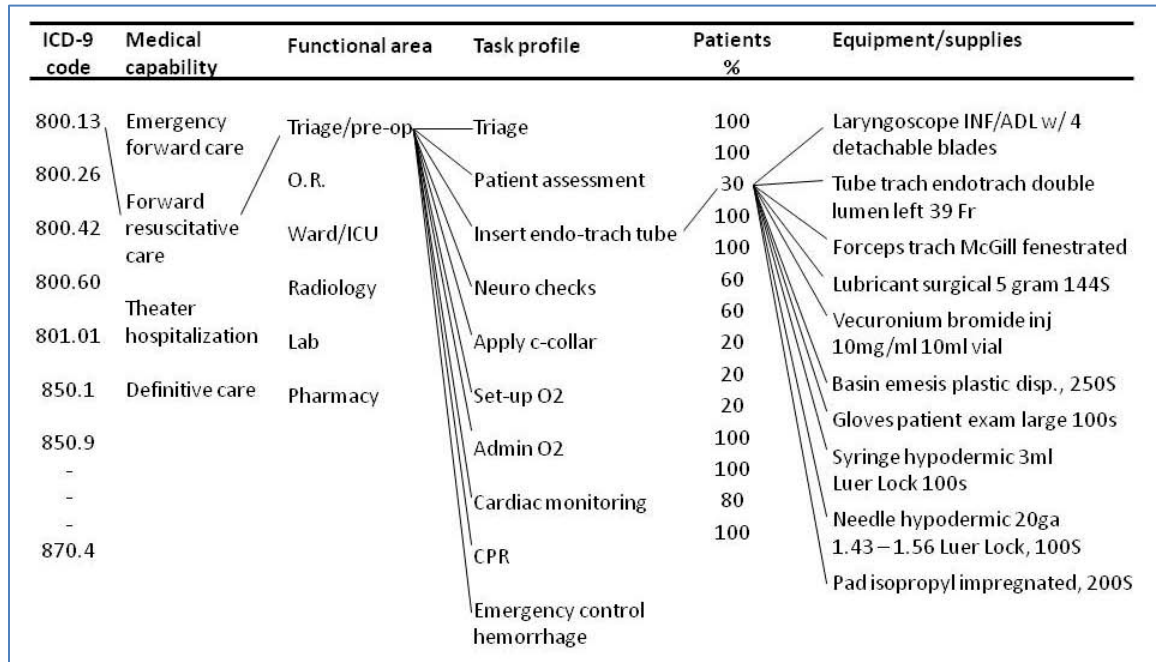

Figure 2. An example of NHRC's programmatic modeling process using a patient ICD-9 Code 800.13.

Capability

The FFMAX provides personnel and equipment to treat adult and pediatric patients for facial trauma management, surgical and non-surgical airway management, and hemorrhage control. Patient treatments include the exploration and drainage of fascial space infections; eradication of dental disease; treatment of salivary gland disease, including ductal injuries; treatment of sinus disease; and management of nerve injuries. Staffing this capability requires an oral surgeon (047S3) and one technician (4Y051).

Results

Change Justification

Modeling and simulation provides visibility for change justifications. These are typically placed in four categories: modernization, clinical requirement, standardization, and redundancy. In this study, 220 line items are recommended for deletion. One item, Prolene suture 4.0, is also found in the Neurosurgical 917D AS; it is recommended as an addition for both standardization and a clinical requirement. One other item recommended for clinical requirement addition is the Prolene suture 5.0. There were 225 line item changes total.

Quantity Changes

The 917P FFMAX AS was optimized using the 938 EMEDS +10 AS. Equipment items that are recommended for deletion from the 917P AS are available, or have a reasonable

substitute, in the 938 AS. This reduced the 917P AS equipment weight by 20%, cube by 16%, and cost by 6%, or \$35,500.

Medications currently in the 917P AS would be drawn from the 938 AS, except penicillin G. This is because penicillin G is not carried by the EMEDS pharmacy, and is a standard of care for many oral maxillofacial surgeries. Optimizing medications reduces the 917P AS pharmacy weight by 98%, cube by 17%, and cost by 32%.

Consumables drawn from the 938 AS will reduce the overall weight by 80%, cube by 87%, and cost by 52%, or \$8,380.00. Prolene sutures, size 4.0 and 5.0, are two recommended additions based on clinical requirements and the SME panel's recommendations.

There are two durable line item changes—exam flashlights are a recommended deletion and maintaining the halogen lamp in the 917P.

Total overall changes resulted in a reduction of weight by 34.5%, cube by 31%, and cost by 6.8%, or \$43,899.08. Table 3 shows an overview of changes by category. A detailed listing of the 917P AS recommended changes is provided in Appendix A. Three items recommended for standardization with the 938 AS are a dental stool, plaster bowl, and an otoscope/ophthalmoscope. The majority of the line items that are recommended for change are consumables that are drawn from the 938 logistics. The medicinal line items are drawn from the 938 pharmacy functional area. The vast majority of surgical equipment line items were drawn from the 938 EMEDS +10/+25 Surgery/Operating Room. Quantities that come from other functional areas are aggregated and listed in Appendix B.

Table 2
FFMAX Weight, Cube, and Cost

Difference	-734.21	-126.17	(\$43,899.08)
% Change	-34.54	-30.96	-6.80

Conclusion

Modeling and simulation was used to study the FFMAX and recommend changes to its AS. The clinical capabilities include personnel and equipment to treat adult and pediatric patients for facial trauma management, surgical and non-surgical airway management, and hemorrhage control. Representative patient streams were developed to represent the type and frequency of patients likely to be seen at this level of care and functional area.

Modeling and simulation tools are essential for projecting appropriate medical care needs for our service personnel. Standardizing equipment and consumables with the Defense Medical Material Program Office-approved items makes the FFMAX creation and resupply more efficient. Updating and maintaining the patient data and FFMAX contents database will ensure that future medical needs are met in the most effective manner.

5f. Work Unit Number: 60334

8. PERFORMING ORGANIZATION REPORT NUMBER

Tech Doc No. 10-12L

10. SPONSOR/MONITOR'S ACRONYM(S)
NMRC/NMSC

11. SPONSOR/MONITOR'S REPORT NUMBER(s)

12. DISTRIBUTION/AVAILABILITY STATEMENT

Approved for public release; distribution is unlimited.

13. SUPPLEMENTARY NOTES

14. ABSTRACT

The Naval Health Research Center (NHRC) has used its modeling and simulation expertise to develop and update conventional U.S. Air Force medical assets since 2004. The objective of this study was to leverage medical modeling and simulation advantages to provide recommendations for allowance standard (AS) configurations based on the U.S. Air Force Oral Surgery Team (FFMAX) operational and clinical requirements.

NHRC analysts reviewed the FFMAX, analyzed clinical requirements with subject matter experts, and used modeling and simulation tools to develop the operationally-based and patient-driven recommended 917P line list. The Unit Type Code capabilities, operational requirements, and materiel solutions were identified, addressing issues of modernization, clinical requirement, standardization, and redundancy. Total recommended changes to the FFMAX would result in a 34.5% weight reduction, a 31% cube reduction, and a 6.8% cost reduction, or \$43,899.08.

15. SUBJECT TERMS

modeling and simulation, EMedKW, allowance standard, oral surgery, Air Force
